

## Deploying a high-availability Xeotek KaDeck cluster

Using the AWS Cloud as an example.

In case of heavy workload, KaDeck Web can be operated in a cluster and thus a load distribution over several instances (scale-out) can take place. This is always useful when a high number of parallel accesses and computationally intensive queries are executed in KaDeck Web.

No configuration adjustment is necessary in KaDeck Web itself. Scaling takes place via load balancers and the container environment.
