

KaDeck Web Deployment Scenarios

Using the AWS Cloud as an example.

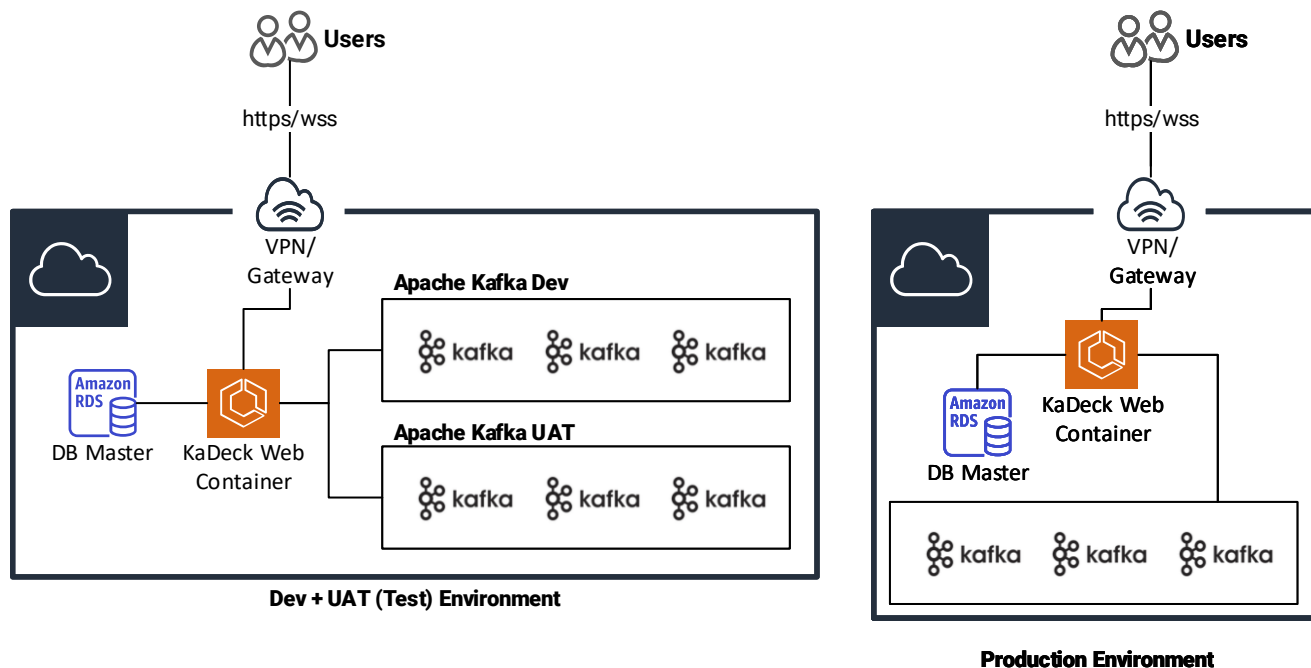

Scenario 1: Separate environments

Note: For each environment, separate KaDeck Web licenses are required.

Scenario 2: Combined environments + Prod

Note: For each environment, separate KaDeck Web licenses are required.

Scale-Out (optional)

In case of high workload, KaDeck Web can be operated in a cluster and thus a load distribution to several instances (Scale-Out) can be achieved. This is always useful if a high number of parallel accesses and computationally intensive queries are executed in KaDeck Web. *No additional licenses are required.*
